In the original publication, in page 129, at the bottom of the left column, parameter μ was wrongly defined as Young's modulus in the formula:

$$M_0 = \mu A s$$

In fact, it corresponds to the rigidity modulus defined by ($\mu = E/2(1+\nu)$) E being Young's modulus and ν being Poisson's Ratio.

However, the following calculations remain correct, as the used values correspond to those of the rigidity.
